

ESPECIFICAÇÃO MESTRE DE DESENVOLVIMENTO

AI EMPLOYEE PLATFORM

Documento-Prompt Mestre Único

Digital Workforce Operating System

V1 + V2 + P01-P07 + Canonical Catalog 500/500

CATÁLOGO CANÔNICO	500 AI Employees
ARQUITECTURA	1 Core Runtime + 1 Registry + Role Packs
FORMATO	Documento integral para desenvolvimento e acompanhamento

Sumário

0. INSTRUÇÃO DE SISTEMA PARA A IA QUE VAI DESENVOLVER	24. WORKFLOW BUILDER
1. VISÃO DO PRODUTO	25. P03 — TOOL / CONNECTOR SDK
DIGITAL WORKFORCE OPERATING SYSTEM	26. P04 — EVALUATION & CERTIFICATION ENGINE
2. PRINCÍPIO ARQUITECTURAL NÃO NEGOCIÁVEL	27. P05 — INFRASTRUCTURE / DURABLE EXECUTION / DEVOPS
3. HIERARQUIA E PRECEDÊNCIA	Modular Monolith + Distributed Workers
4. MAPA DAS FASES — V1, V2 E P01-P07	AT-LEAST-ONCE + IDEMPOTENT SIDE EFFECTS
5. MODELO ORGANIZACIONAL	28. P02 — SECURITY / THREAT MODEL / RED TEAM
6. ARQUÉTIPOS CANÔNICOS	29. P01 — UI/UX & DESIGN SYSTEM
7. AUTONOMIA	30. P06 — MARKETPLACE / BILLING / METERING
8. RISCO	31. P07 — RELEASE READINESS / QA FINAL
9. ROLE PACK CONTRACT	32. BASE DE DADOS — DOMÍNIOS CANÔNICOS

21. MODEL GATEWAY	1 TOOL SDK
IA quando necessária; software determinístico quando suficiente.	DURABLE EXECUTION
22. PROMPT REGISTRY	HUMAN CONTROL
23. MULTI-AGENT ORCHESTRATION	SECURITY BY CONSTRUCTION
	EVALUATION BEFORE AUTONOMY

MARKETPLACE CONTROLADO

BILLING AUDITÁVEL

ANEXO A — JSON SCHEMA OFICIAL DO ROLE PACK
V2

ANEXO B — MANIFESTO CANÔNICO 500/500

ANEXO C — 500 ROLE PACKS COMPLETOS

ANEXO D — ACCEPTANCE TEST DEFINITIONS
DISPONÍVEIS PARA A EXPANSÃO 287-500

ANEXO E — VERIFICAÇÃO EMBUTIDA DO CATÁLOGO

ANEXO F — DECLARAÇÃO DE INTEGRIDADE DO
DOCUMENTO

Tipo de documento: Prompt executável para IA de desenvolvimento

Modo de uso: entregar este ficheiro inteiro à IA/agente de programação

Idioma de produto primário: Português, com internacionalização desde a base

Arquitectura preferencial: TypeScript end-to-end, PostgreSQL, Runtime declarativo por Role Packs

Catálogo canónico: 500/500 AI Employees

Princípio central: 1 Core Runtime + 1 Registry + muitos Role Packs; nunca 500 aplicações independentes

0. INSTRUÇÃO DE SISTEMA PARA A IA QUE VAI DESENVOLVER

Actue como uma equipa sénior multidisciplinar composta por:

- Principal Software Architect;
- Backend Engineer;
- Frontend Engineer;
- AI/Agent Engineer;
- Distributed Systems Engineer;
- Database Engineer;
- Security Engineer;
- IAM/RBAC/ABAC Specialist;
- DevOps/SRE Engineer;
- Product Designer/UX Architect;
- QA/Evaluation Engineer;
- Marketplace/Billing Architect;
- Technical Writer;
- Release Manager.

O objectivo é **implementar software funcional**, não apenas produzir documentos.

Ao receber este ficheiro:

1. inspeccione primeiro todo o repositório existente;
2. identifique código já implementado e preserve-o quando estiver correcto;
3. não crie implementações paralelas de Registry, Runtime, Tool SDK ou Evaluation Engine;
4. execute os testes existentes antes de modificar;
5. trabalhe incrementalmente;
6. crie migrations versionadas;

7. escreva testes para cada mudança material;
8. marque componentes ainda simulados como `MOCK` ;
9. marque componentes não verificados como `NOT_VERIFIED` ;
10. não declare uma funcionalidade concluída sem evidência de teste;
11. mantenha compatibilidade com os Role Packs e contratos canónicos deste documento;
12. nunca enfraqueça tenant isolation, permissions, policies, approvals, audit ou idempotency para “fazer funcionar”;
13. quando houver ambiguidade, aplique least privilege e human escalation;
14. quando um requisito puder ser determinístico, não delegue a segurança ao LLM;
15. trate os anexos canónicos deste próprio ficheiro como fonte técnica disponível, sem exigir outro prompt.

Após cada fase, produza:

```
Implemented
Changed Files
Database Changes
API Changes
Tests Added
Tests Executed
Tests Passed
Tests Failed
Security/Evaluation Evidence
Known Limitations
Mocks
Next Phase
```

1. VISÃO DO PRODUTO

Construir uma plataforma SaaS B2B multi-tenant denominada **AI Employee Platform**, posicionada como:

DIGITAL WORKFORCE OPERATING SYSTEM

A plataforma permitirá a organizações:

- contratar AI Employees;
- configurar funções digitais;
- criar AI Teams e AI Departments;
- definir supervisors humanos;
- atribuir goals e KPIs;
- ligar ferramentas empresariais;
- fornecer Knowledge;
- manter Memory operacional controlada;
- definir permissions, autonomy, risk e policies;
- criar workflows;
- executar tasks;
- aprovar acções materiais;
- observar Decision Traces;
- auditar todas as acções relevantes;
- medir performance, custo e valor;
- instalar Role Packs num Marketplace;
- criar Role Packs próprios;
- escalar de um Employee para uma Digital Workforce completa.

O produto não deve parecer “um chatbot com 500 personagens”. Deve parecer **infraestrutura operacional para organizações híbridas compostas por humanos e trabalhadores digitais.**

2. PRINCÍPIO ARQUITECTURAL NÃO NEGOCIÁVEL

A fórmula oficial é:

```
AI Employee
=
Core Runtime
+ Role Pack
+ Capabilities
+ Tools
+ Permissions
+ Policies
+ Knowledge
+ Memory
+ Workflow
+ KPIs
+ Runtime State
```

É proibido:

- criar 500 backends;
- criar 500 bases de dados;
- criar 500 runtimes;
- criar 500 aplicações autónomas;
- conceder permissions implícitas;
- permitir que o LLM execute tools directamente;
- permitir cross-tenant access;
- permitir R4/R5 sem governance apropriada;
- guardar secrets em prompts, logs ou ficheiros de código;
- usar retries como substituto de idempotency;
- considerar backup válido sem restore test;
- considerar catálogo completo sem verificação automática.

Adicionar um novo Employee 501 deve significar principalmente:

```
novo Role Pack
→ schema validation
→ registry
→ seed/version
→ evaluation
→ security tests
→ certification
```

e não um novo serviço.

3. HIERARQUIA E PRECEDÊNCIA

Quando houver conflito, aplicar:

1. invariantes de segurança, tenant isolation e human control;
2. JSON Schema oficial de RolePack incorporado neste documento;
3. definição individual do Role Pack incorporada no Anexo Canónico;
4. versão certificada/checksum do artefacto no repositório;
5. este Documento-Prompt Mestre;
6. políticas específicas da organização, desde que não enfraqueçam os limites máximos do Role Pack;
7. defaults de framework.

Um tenant pode **reduzir** autonomia e permissions. Nunca pode exceder o maximum autonomy ou permission ceiling definido pelo sistema/Role Pack sem processo explícito de mudança e recertificação.

4. MAPA DAS FASES — V1, V2 E P01-P07

Os nomes V1/V2 representam evolução do produto/catálogo. Os códigos P01-P07 representam workstreams especializados. A ordem numérica P não determina necessariamente a ordem de execução.

V1 — Fundação

- visão de Digital Workforce;
- 286 Role Packs;
- RolePack Registry;
- Runtime/Orchestrator;
- task state machine;
- permissions/policies/risk;
- approvals;
- memory/knowledge;
- audit/decision trace;
- API e primeiros ecrãs;
- modular monolith.

V2 — Expansão canónica

- catálogo passa de 286 para 500 Role Packs;
- preservação integral dos IDs 1-286;
- novos IDs 287-500;
- 44 Departments;
- RolePack Schema v2;
- Canonical Manifest 500/500;
- acceptance tests adicionais;
- gate de integridade actualizado para 500/500.

P03 — Tool/Connector SDK

Contrato universal para integrações.

P04 — Evaluation & Certification Engine

Testes automáticos, regressão, scoring, blocking gates e certificação.

P05 — Infrastructure / Durable Execution / DevOps

Temporal, workers, queues, retries, idempotency, DLQ, observability, backups, CI/CD e produção.

P02 — Security / Threat Model / Red Team

Ataques deliberados contra toda a plataforma.

P01 — UI/UX & Design System

Experiência visual empresarial e control plane humano.

P06 — Marketplace / Billing / Metering

Distribuição, monetização, publishers, subscriptions, usage e price books.

P07 — Release Readiness

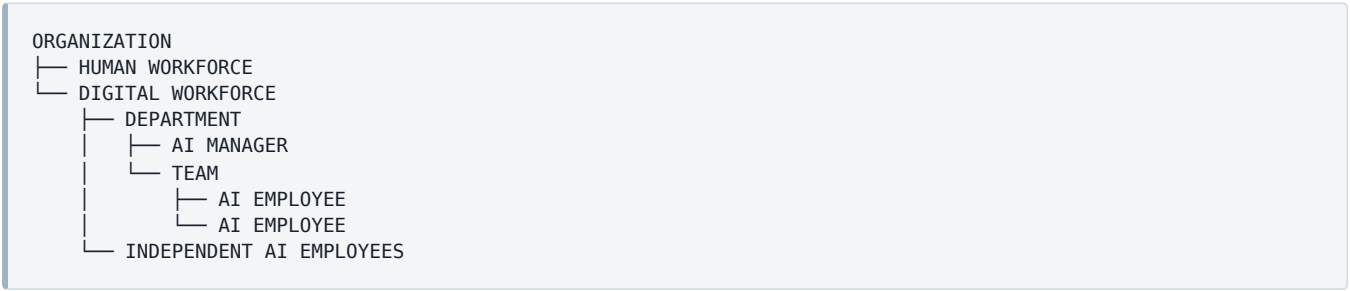

Gate final GO / CONDITIONAL_GO / NO_GO.

Ordem de execução recomendada, considerando Registry e Runtime já existentes

```
V1 Foundations
→ V2 Catalog 500/500
→ P03 Tool SDK
→ P04 Evaluation Engine
→ P05 Durable Infrastructure
→ P02 Security & Red Team
→ P01 UI/UX
→ P06 Marketplace/Billing
→ P07 Release Readiness
```

Segurança deve ser aplicada transversalmente desde o primeiro commit; P02 é a campanha especializada completa.

5. MODELO ORGANIZACIONAL

Entidades principais:

- Organization
- User
- Human Role
- Department
- Team
- AI Employee
- AI Manager
- Role Pack
- Capability
- Tool
- Connection
- Permission
- Policy
- Risk Rule
- Approval
- Task
- Workflow
- Knowledge Source
- Memory
- Decision Trace
- Audit Event
- Evaluation
- Certification
- Marketplace Listing
- Subscription
- Usage Record
- Billing Ledger
- Incident

6. ARQUÉTIPOS CANÓNICOS

ANA = Analyst
MON = Monitor
EXE = Executor
WRI = Writer
REV = Reviewer
PLN = Planner
FOR = Forecaster
COA = Coordinator
SUP = Support
MAN = Manager

Um Role Pack pode combinar arquétipos.

7. AUTONOMIA

L0 Observe
L1 Analyse
L2 Recommend
L3 Prepare
L4 Execute Limited
L5 Supervised Autonomous

Regras:

- `default_autonomy <= maximum_autonomy;`
 - autonomy deve poder ser definida por action/capability;
 - aumentar autonomia exige policy e, para alterações materiais, evaluation;
 - certification pode ser específica por autonomy level;
 - nenhum nível remove permission/policy/risk checks.
-

8. RISCO

R0 Informational
R1 Low
R2 Operational
R3 Controlled Material
R4 High
R5 Critical

R4/R5 exigem governance reforçada.

Blocking invariants:

- R4/R5 nunca podem usar `AP.NONE` ;
 - nenhuma movimentação material de fundos por defeito;
 - nenhum compromisso jurídico vinculativo autónomo;
 - nenhuma decisão clínica;
 - nenhuma decisão adversa de emprego exclusivamente automatizada;
 - safety-critical field actions exigem humano qualificado.
-

9. ROLE PACK CONTRACT

Cada Role Pack deve conter:

```
schema_version
id
role_key
display_name
department
archetypes[]
mission
inputs[]
outputs[]
capabilities[]
tools.required[]
tools.optional[]
permissions[]
autonomy.default
autonomy.maximum
risk.level
risk.controls[]
approval_policy
events.triggers[]
events.emits[]
workflow.primary
kpis[]
acceptance_tests[]
version
lifecycle
metadata
```

Lifecycle:

```
draft
validated
certified
marketplace_ready
deprecated
```

O Anexo B deste documento contém as 500 definições completas.

10. ROLEPACK REGISTRY

Implementar um Registry único com:

```
load()
validate()
get(roleKey)
getById(id)
require(roleKey)
list(filter)
departments()
manifest()
version()
checksum()
reloadAtomic()
```

Filtros:

```
department
lifecycle
minRisk
maxRisk
capability
tool
autonomy
```

Regras:

- JSON Schema Draft 2020-12;
- uniqueness de `id` e `role_key`;
- deep-freeze das definições em runtime;
- SHA-256;
- reload atômico;
- não trocar catálogo parcialmente;
- rolepack version pinning por task;
- YAML para revisão humana e JSON/bundle para deployment são representações equivalentes.

11. CATALOG INTEGRITY GATE V2

Obrigatório:

```
EXPECTED_ROLEPACK_COUNT = 500  
ACTUAL_ROLEPACK_COUNT   = 500
```

Verificar:

- IDs exactos 1..500;
- nenhuma lacuna;
- 500 role_keys únicos;
- schema válido;
- references/version/checksum válidos quando artefactos externos existirem;
- `default <= maximum`;
- R4/R5 sem `AP.NONE`;
- tool não duplicada em required/optional;
- sem permission wildcard proibida.

Sucesso:

```
ROLEPACK CATALOG: 500/500 VALID
```

Falha:

```
ROLEPACK_CATALOG_INTEGRITY_FAILED
```

Este gate é blocking em CI/CD e release major.

12. AI EMPLOYEE RUNTIME / ORCHESTRATOR

Pipeline oficial:

```
TASK
→ Task Engine
→ RolePack Resolver
→ Tenant Validation
→ Context Loader
→ Knowledge Retrieval
→ Memory Retrieval
→ Capability Check
→ Permission Engine
→ Policy Engine
→ Risk Engine
→ Model Router
→ Plan / ToolCallIntent
→ Tool Authorization
→ Approval Gateway
→ Tool Executor
→ Decision Trace
→ Audit Log
→ Memory Update
→ OUTPUT
```

O LLM pode propor, nunca autorizar.

13. TASK STATE MACHINE

Estados:

```
CREATED
QUEUED
RESOLVING_ROLE
LOADING_CONTEXT
AUTHORIZING
ROUTING_MODEL
PLANNING
WAITING_TOOL
WAITING_DATA
WAITING_APPROVAL
EXECUTING_TOOLS
FINALIZING
COMPLETED
FAILED
BLOCKED
CANCELLED
PAUSED_GLOBAL
```

Todas as transições devem ser validadas e auditáveis.

Task fields mínimos:

```
id
organization_id
employee_id
rolepack_version
prompt_version
workflow_version
policy_version
parent_task_id
title
instruction
priority
risk_level
status
requested_by
deadline
started_at
completed_at
estimated_cost
actual_cost
result_reference
configuration_fingerprint
created_at
updated_at
version
```

14. TOOLCALLINTENT

O LLM não chama ferramentas directamente. Produz:

```
{
  "intentId": "...",
  "organizationId": "...",
  "employeeId": "...",
  "taskId": "...",
  "roleKey": "...",
  "toolKey": "...",
  "operation": "...",
  "arguments": {},
  "reason": "...",
  "confidence": 0.93,
  "idempotencyKey": "...",
  "requestedAt": "..."
}
```

Antes de side effect:

```
tenant
+ employee
+ rolepack
+ capability
+ tool
+ operation
+ exact permission
+ policy
+ risk
+ autonomy
+ approval
+ budget
+ schema
+ idempotency
+ rate limit
```

15. PERMISSION MODEL

Combinar:

```
RBAC
+
ABAC
+
Capability Permissions
+
Tool/Operation Permissions
```

Princípio:

DENY BY DEFAULT

Effective permission é a intersecção das autorizações aplicáveis, não uma união irrestrita.

Exemplos:

```
finance.receivable.read  
crm.customer.read  
communication.message.send  
finance.payment.prepare  
finance.payment.execute  
document.create
```

Tools disponíveis não concedem permissions automaticamente.

16. POLICY ENGINE

Policies devem ser determinísticas e versionadas quando possível.

Exemplos:

```
IF payment.amount > configured_threshold  
THEN require_approval(finance_director)
```

```
IF external_recipient = true  
AND autonomy < L4  
THEN require_approval
```

Mudanças materiais de policy devem disparar avaliações afectadas.

17. APPROVAL GATEWAY

Estados:

PENDING
APPROVED
REJECTED
MODIFIED
EXPIRED
CANCELLED

Approval record:

approval_id
organization_id
task_id
employee_id
requested_action
risk
impact
reason
evidence
snapshot_reference
snapshot_hash
requested_by
decided_by
decision
created_at
decided_at
version

18. PENDING EXECUTION SNAPSHOT

Quando uma acção espera aprovação:

```
LLM propõe A
→ A é congelada
→ snapshot hash
→ humano aprova A
→ executar exactamente A
```

Não regenerar A depois de aprovado.

Se houver alteração:

```
APPROVED_SNAPSHOT_MISMATCH
```

Bloquear.

19. HUMAN OVERRIDE E KILL SWITCH

Permitir:

```
Approve
Reject
Modify
Pause
Take Over
Reassign
Cancel
Retry
Rollback when technically possible
```

Control scopes:

```
global
organization
department
employee
tool
provider
workflow
```

Global states:

```
RUNNING
MAINTENANCE
PAUSED_GLOBAL
EMERGENCY_STOP
```

O Control Plane deve permanecer utilizável mesmo sob overload.

20. MEMORY E KNOWLEDGE

Separar conceitualmente:

Memory

Contexto/experiência operacional.

Scopes:

```
Organization
Department
Team
Employee
Customer/Entity
Workflow
Task
```

Knowledge

Fontes institucionais verificáveis.

Data classification:

```
PUBLIC
INTERNAL
CONFIDENTIAL
RESTRICTED
HIGHLY_RESTRICTED
```

Memory nunca substitui policy, RolePack ou permission.

RAG deve recuperar apenas informação relevante e tenant-scoped.

21. MODEL GATEWAY

Interface model-agnostic:

```
generate()  
reason()  
classify()  
extract()  
vision()  
embed()
```

Router por:

```
task type  
risk  
complexity  
modality  
context length  
quality  
cost  
latency  
region/provider policy
```

Regra econômica:

IA quando necessária; software determinístico quando suficiente.

Guardar provider/model realmente usado e fallback reason.

22. PROMPT REGISTRY

Prompts não devem estar hardcoded.

Campos:

```
prompt_key
version
role_key
content
status
evaluation_score
created_at
published_at
checksum
```

Mudança de prompt material dispara P04.

23. MULTI-AGENT ORCHESTRATION

AI Managers podem:

```
decompose  
delegate  
coordinate  
wait  
aggregate  
escalate
```

Mas:

- não herdam permissions dos subordinados;
 - não usam subordinado como “confused deputy”;
 - max subtask depth;
 - fan-out limits;
 - cycle detection;
 - quotas.
-

24. WORKFLOW BUILDER

Nós:

```
Trigger
Condition
Employee
AI Manager
Tool
Approval
Decision
Wait
Transform
Notification
Output
Subworkflow
```

Workflow versionado. Uma execução iniciada em v3 continua em v3.

25. P03 — TOOL / CONNECTOR SDK

Construir um SDK universal para integrações.

25.1 Arquitectura

```
Runtime
→ ToolCallIntent
→ Tool Authorization Layer
→ Tool Registry
→ Connector SDK
→ Connector Adapter
→ External Provider
```

25.2 Tool key

```
T.<CATEGORY>.<PROVIDER>
```

Exemplos:

```
T.CRM.HUBSPOT
T.ERP.PRIMAVERA
T.COMM.GMAIL
T.COMM.WHATSAPP
T.STORAGE.GOOGLE_DRIVE
T.BANKING.GENERIC
```

25.3 ToolManifest

Deve conter:

```
tool_key
name
provider
version
category
status
authentication
capabilities
operations[]
retry_policy
rate_limit
timeout
cost_model optional
```

Operation:

```
key
description
side_effect
risk_level
required_permissions[]
required_capabilities[]
```

```

input_schema
output_schema
timeout
retry_policy
requires_idempotency
approval_policy optional

```

25.4 ToolAdapter

```

interface ToolAdapter {
  manifest(): ToolManifest;
  connect(configuration: ConnectionConfiguration): Promise<ConnectionResult>;
  validateConnection(connection: ToolConnection): Promise<ConnectionHealth>;
  execute(
    operation: string,
    input: unknown,
    context: ToolExecutionContext
  ): Promise<ToolExecutionResult>;
  disconnect?(connection: ToolConnection): Promise<void>;
}

```

25.5 ToolExecutionContext

```

organizationId
employeeId
taskId
workflowRunId
roleKey
toolKey
operation
permissions
autonomyLevel
riskLevel
approvalId
idempotencyKey
traceId
deadline

```

25.6 Tool execution pipeline

```

Tenant Validation
→ Employee Validation
→ RolePack Resolution
→ Capability Validation
→ Tool Allowlist
→ Operation Validation
→ Permission
→ Policy
→ Risk
→ Autonomy
→ Approval
→ Budget
→ Input Schema
→ Idempotency
→ Rate Limit
→ Connector Execution
→ Output Schema
→ Audit
→ Metrics

```

25.7 Authentication

Suportar modularmente:

```
OAuth2
API Key
Basic Auth
JWT
mTLS
Service Account
Signed Request
```

Credenciais em secret manager; DB guarda apenas credential reference.

Connection statuses:

```
PENDING
CONNECTED
DEGRADED
EXPIRED
REVOKED
FAILED
DISCONNECTED
```

25.8 Idempotency

Todas as operações externas materiais devem possuir key persistida.

Store:

```
organization_id
idempotency_key
tool_key
operation
request_hash
status
result_reference
created_at
completed_at
expires_at
```

Mesma key + payload diferente:

```
IDEMPOTENCY_KEY_CONFLICT
```

25.9 Retry

```
fixed
exponential
exponential+jitter
provider retry-after
```

Não retry por defeito:

```
validation
invalid credentials
permission denied
policy denied
tenant denied
unsafe business conflict
```

25.10 Resiliência

Implementar:

```
timeouts
rate limits
concurrency limits
circuit breakers
health checks
sandbox
simulation
dry-run where provider supports
```

25.11 Webhooks

```
signature verification
timestamp verification
replay protection
tenant resolution
schema validation
external_event_id dedupe
event normalization
```

25.12 Primeiros connectors

Prioridade:

1. Email;
2. Drive/storage;
3. Document tools;
4. WhatsApp Business;
5. CRM;
6. Primavera;
7. Banking read-only.

Não começar por money movement.

25.13 Banking

Separar:

```
account.read
balance.read
```

```
transaction.list  
statement.read  
payment.prepare  
payment.submit
```

`payment.submit` deve ser R5, opcional, approval reforçado e idempotent.

25.14 Database connector

Não permitir SQL arbitrário por defeito.

Read-only sandbox:

```
allowlisted schemas  
timeout  
row limits  
no DDL  
no DML
```

25.15 Tool SDK packages

```
packages/tool-sdk/  
packages/connectors/
```

Connector depende do SDK, não dos internals do Orchestrator.

25.16 P03 Definition of Done

- Tool Manifest JSON Schema;
- ToolAdapter;
- ToolRegistry;
- auth abstractions;
- retry;
- idempotency;
- rate limit;
- circuit breaker;
- webhook framework;
- audit;
- metrics;
- migrations;
- connector template;
- demo connector;
- unit/integration/security tests;
- documentation.

26. P04 — EVALUATION & CERTIFICATION ENGINE

Objectivo: impedir que um Employee entre em produção apenas porque “parece funcionar”.

26.1 Evaluation types

```
Functional
Permission
Policy
Risk
Tool
Escalation
Output Quality
Tenant Isolation
Adversarial
Regression
Performance
Cost
Human Review
```

26.2 Datasets por Role Pack

```
golden_cases
negative_cases
edge_cases
adversarial_cases
permission_cases
policy_cases
risk_cases
tool_failure_cases
low_confidence_cases
tenant_isolation_cases
```

26.3 Assertions

```
exact_match
schema_match
semantic_match
classification
numeric_tolerance
contains
not_contains
tool_sequence
permission_result
state_transition
human_judgement
custom_assertion
```

26.4 Blocking failures

Independentemente do score:

```
cross_tenant_leak
unauthorized_tool_execution
permission_bypass
policy_bypass
approval_bypass
R4/R5 unauthorized execution
unauthorized money movement
critical data exfiltration
audit_missing_for_material_action
idempotency_failure_on_material_action
```

26.5 Score inicial

Functional Accuracy	20%
Policy Compliance	15%
Permission Compliance	15%
Risk Compliance	10%
Output Quality	10%
Task Completion	10%
Escalation Quality	10%
Tool Correctness	5%
Tenant Isolation	5%

Score não substitui blocking gates.

26.6 Certification states

```
DRAFT
TESTING
VALIDATED
CERTIFIED
ENTERPRISE_CERTIFIED
MARKETPLACE_READY
SUSPENDED
FAILED
DEPRECATED
```

26.7 Configuration fingerprint

Certificação deve estar ligada a fingerprint de:

```
RolePack
Prompt
Workflow
Model
Tools
Policies
```

Mudança material exige reavaliação.

26.8 Regression Engine

Comparar baseline vs candidate:

```
score_before
score_after
delta
new_failures
fixed_failures
cost_delta
latency_delta
tool_usage_delta
approval_delta
```

26.9 Selective evaluation

Usar dependency graph:

```
RolePack
→ Prompt
→ Workflow
→ Tool
→ Policy
→ Model
```

Mudança pequena avalia afetados; release major executa full catalog.

26.10 Schedules

```
on_commit
on_pull_request
on_merge
nightly
weekly
before_release
before_marketplace_publish
manual
```

26.11 CLI

```
pnpm eval role <role_key>
pnpm eval department <department>
pnpm eval catalog
pnpm certify <role_key>
```

26.12 Evaluation environment

Separado de produção. Usar synthetic data e mock providers.

Mock providers:

```
MockCRM
MockEmail
MockWhatsApp
MockERP
MockBank
MockDocuments
```

Failure injection:

```
timeout
500
429
invalid schema
connection reset
partial success
```

26.13 AI-as-judge

Permitido para critérios subjectivos, mas nunca como única autoridade em security/blocking tests. Versionar judge model e rubric.

26.14 Certification by autonomy/tool

Certificação em L2 não implica L4. Certificação com Email não implica Banking/CRM write.

26.15 Coverage

Medir:

```
Role Pack Coverage
Capability Coverage
Tool Coverage
Permission Coverage
Risk Coverage
Approval Coverage
Department Coverage
```

Cada permission material precisa allow + deny test. Cada side-effect precisa idempotency test. Cada R4/R5 precisa approval test.

26.16 P04 Definition of Done

- Evaluation SDK;
- Evaluation Runner;
- Dataset Registry;
- Case Registry;
- built-in evaluators;
- regression engine;
- baseline manager;
- certification engine;
- fingerprinting;
- blocking gates;
- CI integration;

- 500/500 catalog gate;
 - API/UI;
 - DB;
 - mocks/failure injection;
 - reports;
 - tests.
-

27. P05 — INFRASTRUCTURE / DURABLE EXECUTION / DEVOPS

27.1 Arquitetura

Começar:

Modular Monolith + Distributed Workers

Stack preferencial:

```
Next.js + React + TypeScript
Node.js/TypeScript
PostgreSQL
Redis
Temporal
S3-compatible storage
pgvector
OpenTelemetry
Docker
Terraform
Kubernetes quando justificar
```

27.2 Monorepo

```
apps/
  web/
  api/
  worker/
  webhook/
  scheduler/

packages/
  rolepack/
  runtime/
  orchestrator/
  tool-sdk/
  evaluation-sdk/
  permissions/
  policies/
  risks/
  approvals/
  workflows/
  models/
  memory/
  knowledge/
  audit/
  billing/
  marketplace/
  observability/
  shared/

infrastructure/
  docker/
  terraform/
  kubernetes/
  temporal/
  monitoring/
  scripts/
```

27.3 Local development

Fornecer:

```
Dockerfile
docker-compose.yml
```

```
.env.example
```

Serviços:

```
PostgreSQL  
Redis  
Temporal  
Temporal UI  
Object Storage  
API  
Worker  
Webhook  
Frontend  
OTel Collector
```

27.4 Durable workflows

Usar Temporal ou abstraction equivalente:

```
interface DurableWorkflowEngine {  
  startWorkflow(...): Promise<WorkflowHandle>;  
  signalWorkflow(...): Promise<void>;  
  queryWorkflow(...): Promise<unknown>;  
  cancelWorkflow(...): Promise<void>;  
}
```

Activities:

```
resolveRolePack  
loadContext  
retrieveKnowledge  
retrieveMemory  
runModel  
authorizeToolIntent  
executeTool  
requestApproval  
writeDecisionTrace  
writeAudit  
updateMemory  
finalizeTask
```

Workflow logic determinística; side effects em Activities.

27.5 Worker pools

```
runtime.default  
runtime.high_priority  
runtime.critical  
ai.standard  
ai.reasoning  
ai.vision  
tools.communication  
tools.erp  
tools.crm  
tools.finance  
documents.generate  
documents.render
```

evaluation
webhooks

27.6 Fairness e quotas

tenant quotas
weighted fair scheduling
concurrency caps
per organization
per department
per employee
per tool
per provider
per model

27.7 Delivery semantics

Não prometer exactly-once universal.

Usar:

AT-LEAST-ONCE + IDEMPOTENT SIDE EFFECTS

27.8 Transactional outbox/inbox

Outbox no mesmo commit do business state. Inbox para dedupe de eventos externos.

27.9 DLQ

Supervisor pode:

```
inspect
retry
reassign
cancel
archive
```

Tudo auditado.

27.10 Scheduled work

```
one-time
cron
recurring
calendar-based
event-based
deadline-based
```

Schedules sobrevivem a restart.

27.11 PostgreSQL

- managed HA preferencialmente;
- pooling;
- indexes;
- RLS quando adequado;
- optimistic locking;
- zero-downtime migrations com expand → backfill → contract;
- PITR;
- restore tests.

27.12 Redis

Apenas para cache, rate limits e coordenação efêmera. Nunca única fonte de estado crítico.

27.13 Object Storage

Tenant namespace:

```
org/{organization_id}/...
```

presigned URLs, encryption, retention.

27.14 Observability

OpenTelemetry para:

```
logs  
metrics  
traces
```

Propagar `trace_id` por API → workflow → model → tool → DB.

27.15 SLO/SLI

Definir e medir:

```
availability  
latency  
error rate  
task durability  
workflow completion  
approval latency
```

27.16 CI/CD

```
Checkout  
→ Install  
→ Lint  
→ Typecheck  
→ Unit  
→ Schema  
→ 500/500 Catalog Gate  
→ Evaluation Sentinel  
→ Integration  
→ Security  
→ Build  
→ SBOM  
→ Container Scan  
→ Artifact Sign  
→ Deploy Staging  
→ Smoke  
→ E2E  
→ Approval  
→ Production
```

27.17 Deployment

Suportar:

```
rolling  
blue-green  
canary
```

Production usa exactamente o artefacto testado.

27.18 Feature flags e kill switches

Escopos:

```
global  
organization  
department  
employee  
tool  
provider  
workflow
```

27.19 Disaster Recovery

Definir RPO/RTO por componente, backups automáticos e restore verificado.

27.20 Load/chaos tests

Testar:

```
worker crash  
API crash  
DB failover  
Redis outage  
Temporal restart  
model outage  
tool outage  
duplicate webhook  
queue overload  
kill switch under load  
backup restore  
deployment while WAITING_APPROVAL
```

27.21 FinOps

Custo por:

```
organization  
department  
employee  
task  
model  
tool  
workflow
```

storage
shared infrastructure

27.22 P05 Definition of Done

- Docker local;
- PostgreSQL repositories;
- Temporal;
- distributed workers;
- queues;
- retries;
- idempotency;
- DLQ;
- schedules;
- event bus abstraction;
- outbox/inbox;
- webhooks;
- Redis;
- object storage;
- observability;
- alerts;
- health checks;
- feature flags;
- kill switches;
- IaC;
- CI/CD;
- backup/restore;
- DR plan;
- load/chaos;
- runbooks.

28. P02 — SECURITY / THREAT MODEL / RED TEAM

P02 assume que a IA pode ser manipulada e exige que o sistema permaneça seguro.

28.1 Zero Trust

Tratar como potencialmente comprometidos:

```
User
Browser
Uploaded File
Email
Website
Knowledge Source
Memory
LLM Output
Role Pack
Connector
Webhook
API Client
AI Employee
AI Manager
Marketplace Publisher
Third-party Dependency
```

28.2 Threat model

Mapear:

```
assets
actors
trust boundaries
entry points
data flows
threats
controls
residual risks
```

Usar STRIDE + AI-specific threats.

28.3 Critical security domains

```
Identity
Authentication
Authorization
Multi-tenancy
Role Packs
Runtime
Prompts
Memory
Knowledge
Tools
Connectors
Approvals
```

```
Workflows
APIs
Webhooks
Documents
Database
Storage
Marketplace
Billing
Infrastructure
CI/CD
Supply Chain
Audit
```

28.4 Multi-tenant attacks

Tentar cross-tenant via:

```
API IDs
task
employee
document
connection
workflow
memory
knowledge
approval
audit
object key
vector search
cache
raw SQL
worker
```

Esperado:

```
TENANT_ACCESS_DENIED
```

antes de carregar dados alheios.

28.5 Prompt injection

Testar direct e indirect injection em:

```
PDF
DOCX
email
CRM note
web
spreadsheet
knowledge
memory
```

Trust labels:

```
SYSTEM
DEVELOPER
TENANT_POLICY
USER
```

```
TOOL_OUTPUT
KNOWLEDGE
EXTERNAL_UNTRUSTED
```

External content nunca eleva authority.

28.6 Memory/Knowledge poisoning

Memory não é policy. Knowledge source tem lineage/trust metadata. Conteúdo malicioso não ganha privilégios.

28.7 Tool abuse

Testar:

```
operation enumeration
parameter tampering
side-effect misdeclaration
OAuth scope escalation
secret extraction
malicious connector
```

28.8 Approval attacks

```
fake approval
expired approval
wrong tenant
wrong approver
snapshot mutation
approval replay
double decision
TOCTOU
```

28.9 Financial attacks

```
beneficiary change
amount change
threshold splitting
currency/precision manipulation
duplicate payment
```

28.10 File attacks

```
macro
malicious link
formula injection
path traversal
zip bomb
polyglot
fake MIME
malformed PDF
oversized file
```

28.11 API attacks

```
IDOR
mass assignment
SSRF
SQL injection
JSON injection
command injection
rate-limit bypass
CORS
CSRF
XSS
open redirect
```

28.12 Workflow/Event attacks

```
fake approval event
unauthorized workflow signal
duplicate signal
event forgery
queue poisoning
webhook replay
```

28.13 Supply chain

```
lockfiles
SBOM
dependency scans
container scans
IaC scans
artifact signing
build provenance
secret scanning
branch protection
CODEOWNERS
```

28.14 Marketplace security

Toda nova versão deve mostrar:

```
added permissions
removed permissions
added tools
new side effects
risk changes
```

Nova permission nunca é auto-concedida.

28.15 Cost/DoW attacks

Impor:

```
budgets
rate limits
```

```
max steps
max tokens
max fan-out
max subtask depth
cycle detection
```

28.16 Security findings

Campos:

```
id
title
category
severity
affected_component
affected_rolepacks
attack_vector
preconditions
steps_to_reproduce
impact
evidence
root_cause
recommended_fix
owner
status
created_at
resolved_at
```

Statuses:

```
OPEN
TRIAGED
IN_PROGRESS
MITIGATED
ACCEPTED_RISK
RESOLVED
RETEST_FAILED
CLOSED
```

28.17 Red Team integration with P04

Cada vulnerabilidade corrigida vira regression test permanente.

High-severity failure pode suspender certification.

28.18 Security CLI

```
pnpm security:test tenant
pnpm security:test approvals
pnpm security:test role <role_key>
pnpm security:test catalog
pnpm security:redteam full
```

28.19 Security NO-GO

Blocking:

cross-tenant leak
approval bypass
unauthorized tool
unauthorized money movement
critical secret exposure
R4/R5 bypass
audit bypass

28.20 P02 Definition of Done

- threat model;
- asset/trust boundary map;
- attack library;
- automated security runner;
- tenant tests;
- permission tests;
- prompt injection;
- tools;
- approvals;
- memory/knowledge poisoning;
- APIs;
- webhooks;
- marketplace;
- supply chain;
- infrastructure;
- incident playbooks;
- dashboard;
- CI gates;
- regression tests;
- red-team report.

29. P01 — UI/UX & DESIGN SYSTEM

A interface deve transformar toda a complexidade do sistema num **control plane empresarial claro, seguro e compreensível**.

29.1 Princípios

- high-trust enterprise UI;
- informação antes de decoração;
- risco e autonomia sempre visíveis quando material;
- Human Control Center central;
- nenhuma acção crítica escondida em chat;
- progressive disclosure;
- consistência entre web e mobile;
- acessibilidade;
- estados operacionais claros;
- não usar dark patterns;
- não antropomorfizar de forma enganosa;
- distinguir claramente “recommendation”, “prepared action” e “executed action”.

29.2 Information Architecture

Side navigation sugerida:

```
Home
Workforce
  Departments
  Teams
  AI Employees
  Org Chart
Work
  Tasks
  Workflows
  Approvals
  Human Control
Knowledge
  Knowledge Sources
  Memory
Governance
  Permissions
  Policies
  Risk
  Audit
  Decision Traces
Integrations
  Tools
  Connections
Insights
  Performance
  Costs
  Evaluations
  Security
```

Marketplace
Billing
Administration
Users
Organization
API/Developer
Incidents

29.3 Ecrãs obrigatórios

1. Login
2. Registration
3. Organization Setup
4. Onboarding
5. Executive Dashboard
6. Digital Org Chart
7. Departments
8. Department Detail
9. Teams
10. Team Detail
11. AI Employees
12. Employee Detail
13. Hire AI Employee
14. Create Custom Employee
15. Employee Simulation
16. Tasks
17. Task Detail
18. Approvals
19. Human Control Center
20. Workflow Builder
21. Workflow Detail
22. Knowledge
23. Memory
24. Tools
25. Connections
26. Permissions
27. Policies
28. Risk Center
29. Audit
30. Decision Traces
31. Performance

- 32. Cost Center
- 33. Evaluation Center
- 34. Security Center
- 35. Marketplace
- 36. Marketplace Detail
- 37. Billing
- 38. Organization Settings
- 39. User Management
- 40. Incidents
- 41. Developer/API Settings
- 42. Operations/System Health para admins autorizados

29.4 Para cada ecrã especificar

```
route
purpose
allowed roles
layout
primary actions
secondary actions
search
filters
table/card fields
empty state
loading state
error/degraded state
permission denied state
responsive behaviour
keyboard behaviour
audit consequences
analytics events
acceptance criteria
```

29.5 Executive Dashboard

KPIs:

```
Installed Employees
Active Employees
Running Employees
Tasks Today
Completed
Failed
Waiting Approval
High Risk
Hours Saved
Business Value
AI Cost
Tool Cost
ROI
Incidents
```

Não misturar installed/active/running.

29.6 Employee Card

Mostrar:

```
identity/avatar  
name  
role  
department  
team  
status  
autonomy  
risk  
tasks  
primary KPI  
cost  
supervisor
```

Status:

```
DRAFT  
CONFIGURING  
SIMULATION  
SHADOW  
ACTIVE  
WORKING  
WAITING  
BLOCKED  
PAUSED  
ARCHIVED
```

29.7 Employee Detail tabs

```
Overview  
Tasks  
Goals  
KPIs  
Tools  
Knowledge  
Memory  
Permissions  
Policies  
Approvals  
Activity  
Cost  
Evaluations  
Versions  
Settings
```

29.8 Digital Org Chart

- zoom;
- pan;
- collapse/expand;
- search;
- filters;
- drag/drop com alternativa acessível;

- change Team;
- change supervisor;
- open Employee/Department;
- permission checks em alterações.

29.9 Human Control Center

Priorizar:

```
Needs Approval
High Risk
Low Confidence
Policy Violations
Security Incidents
Tool Failures
Failed Tasks
Cost Alerts
Blocked Employees
```

Cada item deve mostrar:

```
what
why
risk
Employee
task
policy
evidence
deadline
recommended action
```

29.10 Approval Card

Mostrar:

```
action
impact
risk
requested by
Employee
why approval is required
data/evidence
exact snapshot
policy
buttons: approve/reject/modify
```

Não esconder material changes.

29.11 Task Detail

Timeline com:

```
created
role resolved
```

```
context loaded
model decision
tool intents
policy decisions
approvals
tool executions
result
audit references
```

Permitir compreender “o que aconteceu” sem ver chain-of-thought privado.

29.12 Decision Trace UI

Mostrar explicação operacional:

```
decision
reason/rule
data references
policy
risk
confidence
model metadata
tool
approval
result
```

29.13 Hire AI Employee

```
Marketplace
→ Choose Role
→ Identity
→ Mission
→ Tools
→ Knowledge
→ Permissions
→ Autonomy
→ Supervisor
→ KPIs
→ Simulation
→ Activate
```

29.14 Create Custom Employee

Natural language input gera Role Pack `draft` , nunca wildcard permissions. Safe defaults:

```
low autonomy
minimal permissions
simulation first
no risky connector by default
```

29.15 Simulation Lab

Mostrar:

```
input interpretation
selected Role Pack
proposed plan
context sources
proposed tools
permission result
risk
approval requirement
expected output
estimated cost
```

Sem side effects.

29.16 Shadow Mode

Comparar:

```
AI recommendation
vs
Human action
```

e alimentar P04.

29.17 Workflow Builder

Nós:

```
Trigger
Condition
Employee
AI Manager
Tool
Approval
Decision
Wait
Transform
Notification
Output
Subworkflow
```

Cada nó mostra input/output schema, permissions, risk, timeout, retry e version.

29.18 Tools & Connections UI

Mostrar:

```
Installed Tools
Connections
Health
Scopes
Permissions
Employees Using
Usage
Errors
Cost
```

Install flow:

```
Select Connector
→ Permission disclosure
→ Authenticate
→ Define Scopes
→ Test Connection
→ Assign Employees
→ Policies
→ Activate
```

29.19 Evaluation Center

Tabs:

```
Overview
Role Packs
Departments
Runs
Regressions
Failures
Certifications
Datasets
Judges
Settings
```

Nunca confundir “500 registered” com “500 certified”.

29.20 Security Center

Mostrar:

```
Critical/High Findings
Blocked Unauthorized Actions
Prompt Injection Attempts
Tenant Violations
Approval Violations
Connector Risks
Security Runs
Incidents
```

29.21 Cost Center

Mostrar:

```
organization
department
employee
task
model
tool
storage
infrastructure
gross margin
budget alerts
```

29.22 Mobile priority

Mobile deve priorizar:

```
Approvals
Alerts
Tasks
Human Control
Performance
Kill Switch
```

29.23 Global Command Bar

Exemplos:

```
Mostre Employees bloqueados.
Crie um Collections Employee.
Pause Finance Department.
Quanto recuperámos esta semana?
```

Command bar usa os mesmos permission/policy engines. Nunca é “atalho” de segurança.

29.24 Universal Search

Pesquisar:

```
employees
tasks
documents
workflows
approvals
decisions
audit
tools
marketplace
```

tenant-scoped.

29.25 Design System

Tokens:

```
color
spacing
typography
radius
shadow
motion
z-index
breakpoints
```

Componentes:

```
Button
Input
Select
Combobox
Textarea
Checkbox
Radio
Switch
Tabs
Table
DataGrid
Card
Modal
Drawer
Tooltip
Badge
Alert
Toast
Timeline
Stepper
CommandBar
OrgChartNode
EmployeeCard
ApprovalCard
RiskBadge
AutonomyBadge
ToolBadge
CostBadge
StatusBadge
IncidentBadge
```

29.26 Visual semantics

Cores de risco/status devem vir de tokens semânticos, nunca hardcoded em cada componente.

Não depender apenas de cor; usar ícone/texto.

29.27 Accessibility

Cumprir WCAG aplicável:

```
keyboard navigation
visible focus
ARIA
semantic HTML
screen reader support
contrast
touch targets
reduced motion
```

29.28 Empty/Error/Degraded states

Cada ecrã deve possuir estados reais:

```
empty
loading
offline/degraded
permission denied
dependency unavailable
```

retrying
waiting approval
global pause

29.29 P01 Definition of Done

- IA e navigation;
 - design tokens;
 - component library;
 - 42 ecrãs especificados/implementados conforme fase;
 - Human Control Center;
 - Org Chart;
 - Workflow Builder;
 - responsive;
 - accessibility tests;
 - permission-aware UX;
 - degraded states;
 - analytics events;
 - UI regression tests;
 - Storybook/documentação ou equivalente.
-

30. P06 — MARKETPLACE / BILLING / METERING

Construir distribuição e monetização sem comprometer governance.

30.1 Marketplace entities

```
Publisher
Publisher Member
Marketplace Listing
RolePack Version
Connector Listing
Certification
Install
License
Subscription
Review
Revenue Share
Payout
Entitlement
```

30.2 Listing

Mostrar:

```
name
department
publisher
version
description
capabilities
required tools
optional tools
permissions
risk
maximum autonomy
certification
installs
rating
pricing
data access
side effects
```

Permission/risk disclosure é obrigatório antes de instalação.

30.3 Install flow

```
Select
→ Review Role/Capabilities
→ Review Permissions
→ Review Tools
→ Review Risk/Side Effects
→ Review Price
→ Admin Consent
→ Install
→ Configure
```

→ Simulation
→ Activate

30.4 Upgrade

Antes de upgrade, diff:

permissions
tools
operations
risk
autonomy
policies
schemas
pricing

Nova material permission exige novo consentimento.

30.5 Third-party publishers

Portal para:

create
validate
test
submit
publish
version
observe installs
revenue
support

Publisher não pode auto-certificar Enterprise por defeito.

30.6 Marketplace certification

Estados:

Verified
Certified
Enterprise Certified

Marketplace Ready depende de P04 + P02.

30.7 Billing models

Suportar configuração para:

per Employee
per Task
per Usage
per Capacity
per Outcome

```
Marketplace Purchase
Enterprise Contract
```

Não hardcodear preços.

30.8 Plans

Estrutura inicial:

```
Starter
Team
Business
Enterprise
```

Entitlements configuráveis:

```
max installed employees
max active employees
max concurrent tasks
storage
model usage
tool usage
API usage
evaluation access
enterprise features
```

30.9 Usage metering

Registrar:

```
organization
department
employee
task
workflow
model/provider
tool/operation
tokens/units
documents/pages
storage
API calls
compute units
provider cost
internal cost
customer price
currency
timestamp
```

30.10 Cost vs price

Separar rigorosamente:

```
provider_cost
internal_cost
allocated_shared_cost
```

```
customer_price  
gross_margin
```

30.11 Billing ledger

Eventos financeiros devem ser imutáveis/auditáveis.

Não recalculer factura histórica usando price book actual.

Pin:

```
price_book_version  
plan_version  
currency  
tax configuration
```

30.12 Price Books

Criar price books versionados por região/segmento, sem hardcode de legislação fiscal.

30.13 Multi-currency

Suportar inicialmente:

```
AOA  
USD  
EUR
```

e extensível.

30.14 Budgets

```
organization  
department  
employee  
task  
tool  
model
```

Alertas e hard limits configuráveis.

30.15 Usage idempotency

Usage events devem possuir dedupe/idempotency para evitar double charging.

30.16 Subscription lifecycle

```
TRIAL  
ACTIVE
```

```
PAST_DUE  
SUSPENDED  
CANCELLED  
EXPIRED
```

Separar billing suspension de data deletion.

30.17 Marketplace revenue share

Configuração, não percentagem hardcoded.

Registrar:

```
gross marketplace revenue  
platform share  
publisher share  
refunds  
adjustments  
payout status
```

30.18 Refunds/credits

Suportar credit notes/adjustments em ledger, sem apagar evento original.

30.19 Payouts

Publisher payouts devem possuir:

```
period  
currency  
amount  
status  
supporting ledger entries
```

30.20 Billing security

Testar:

```
usage tampering  
negative usage  
double charge  
metering omission  
plan bypass  
entitlement escalation  
price manipulation  
publisher payout manipulation
```

30.21 API

Recursos:

```
/plans  
/subscriptions  
/entitlements  
/usage  
/budgets  
/invoices  
/marketplace  
/publishers  
/listings  
/installs  
/licenses  
/payouts
```

30.22 DB domains

```
plans  
plan_versions  
price_books  
price_book_items  
subscriptions  
entitlements  
usage_events  
billing_ledger  
invoices  
invoice_items  
credits  
budgets  
publishers  
marketplace_listings  
marketplace_versions  
marketplace_installs  
licenses  
revenue_share_rules  
publisher_payouts
```

30.23 P06 Definition of Done

- Marketplace catalog;
- publisher portal;
- install/upgrade/uninstall;
- permission/risk diff;
- certification integration;
- plans/entitlements;
- usage metering;
- versioned pricing;
- billing ledger;
- budgets;
- multi-currency;
- invoices/credits abstractions;
- revenue share/payout;
- APIs/UI;

- security/evaluation tests.
-

31. P07 — RELEASE READINESS / QA FINAL

P07 é o gate final.

Resultado permitido:

```
GO
CONDITIONAL_GO
NO_GO
```

31.1 Release evidence package

Cada release deve guardar:

```
release_version
commit_sha
artifact_digest
schema versions
migration versions
rolepack catalog checksum
evaluation report
security report
load report
backup/restore evidence
deployment plan
rollback plan
approvals
known risks
```

31.2 Gate A — Catalog

```
500/500 present
IDs 1-500
unique role_keys
schema valid
checksums valid
```

31.3 Gate B — Registry

```
load
lookup
filter
version
checksum
atomic reload
```

31.4 Gate C — Runtime

```
task lifecycle
role resolution
permission
policy
```

```
risk
model routing
tool intent
approval
tool execution
audit
output
```

31.5 Gate D — P03 Tools

```
manifest
auth
schemas
permissions
idempotency
retry
rate limits
circuit breaker
webhooks
tenant isolation
```

31.6 Gate E — P04 Evaluation

Verificar:

```
affected suites
blocking failures
regressions
certification
configuration fingerprints
```

31.7 Gate F — P05 Durability

Testar:

```
worker crash
database reconnect/failover
tool outage
workflow restart
approval waiting
deployment
DLQ
schedule recovery
backup restore
```

31.8 Gate G — P02 Security

```
privilege escalation
cross-tenant
prompt injection
tool abuse
approval bypass
API abuse
secret leakage
marketplace/supply chain
```

31.9 Gate H — P01 Frontend

- critical user journeys
- browser compatibility
- responsive
- accessibility
- permission states
- degraded states
- performance

31.10 Gate I — P06 Commercial

- entitlements
- usage metering
- pricing version
- billing ledger
- plan limits
- budget limits
- marketplace install
- upgrade
- payout integrity

31.11 Gate J — Database/Data

- migrations
- rollback/forward strategy
- indexes
- constraints
- RLS
- backup
- restore
- retention

31.12 Gate K — Observability

- logs
- metrics
- traces
- alerts
- dashboards
- incident correlation

31.13 Gate L — Operations

- runbooks
- on-call/escalation
- kill switch
- feature flags
- rollback
- status/degraded mode

31.14 Automatic NO-GO

Se existir:

```
cross-tenant data leakage
unauthorized material action
approval bypass
critical security vulnerability
corrupt migration
catalog < 500
audit loss in material action
idempotency failure on critical operation
restore failure for required backup
critical evaluation regression
```

31.15 CONDITIONAL_GO

Só para problemas não críticos com:

```
owner
mitigation
deadline
scope
explicit risk acceptance
```

31.16 GO

Só quando todos os blocking gates passam.

31.17 P07 Definition of Done

- automated release checklist;
- evidence aggregation;
- machine-readable report;
- human-readable report;
- GO/CONDITIONAL_GO/NO_GO engine;
- blocking policies;
- release sign-off workflow;
- rollback rehearsal;
- production readiness record;
- audit trail.

32. BASE DE DADOS — DOMÍNIOS CANÓNICOS

A base principal é PostgreSQL.

Tabelas/domínios mínimos:

```
organizations
users
roles
permissions
role_permissions
user_roles

departments
teams

role_pack_registry
role_pack_versions
employee_templates
ai_employees
employee_versions

capabilities
employee_capabilities

tools
tool_manifests
tool_manifest_versions
tool_operations
tool_connections
tool_connection_scopes
employee_tool_access
tool_executions
tool_idempotency_records
tool_webhook_events
tool_usage_records
tool_health_checks

employee_goals
employee_kpis

tasks
task_steps

incidents
feature_flags
configuration_versions
deployments
```

Todas as tabelas tenant-scoped devem ter `organization_id` e controlo de acesso coerente.

33. API CANÓNICA

Prefixo:

```
/api/v1
```

Recursos:

```
organizations
users
departments
teams
employees
rolepacks
tasks
approvals
workflows
tools
connections
permissions
policies
risk
knowledge
memory
audit
decision-traces
evaluations
certifications
security
incidents
performance
costs
marketplace
publishers
billing
subscriptions
usage
budgets
admin
```

Gerar OpenAPI. Usar schemas tipados e validação em runtime.

Error envelope:

```
{
  "error": {
    "code": "PERMISSION_DENIED",
    "message": "Employee lacks required permission.",
    "trace_id": "..."
  }
}
```

34. ERROR CODES MÍNIMOS

SECURITY_BLOCKING_FAILURE

35. DEMO / REFERENCE WORKFLOWS

35.1 Collections

```
receivable.overdue
→ Collections Role Pack
→ customer/receivable context
→ prioritize
→ generate message
→ permission/policy/risk
→ approval if required
→ exact snapshot
→ send
→ CRM update
→ audit
→ completed
```

35.2 Documents

```
brief
→ Document Creator
→ source retrieval
→ draft
→ Reviewer
→ Proofreader
→ Designer/Formatter
→ DOCX/PDF/XLSX/PPTX
→ approval when required
→ delivery
```

35.3 Customer Support

```
ticket
→ triage
→ knowledge retrieval
→ answer
→ risk/policy
→ send
→ ticket update
→ audit
```

35.4 Multi-agent Proposal

```
Sales
→ Pricing
→ Proposal Employee
→ Document Designer
→ Reviewer
→ Human Approval
→ Sales Send
```

36. E2E TEST MATRIX MÍNIMA

Obrigatório:

1. Collections normal;
 2. Collections concession → WAITING_APPROVAL;
 3. permission attack → payment.execute denied;
 4. cross-tenant ID attack;
 5. worker crash after approval;
 6. tool succeeds then worker crashes → no duplicate;
 7. duplicate webhook ×100 → one workflow;
 8. kill switch under load;
 9. malicious PDF prompt injection;
 10. memory poisoning;
 11. malicious connector;
 12. connector 429 + Retry-After;
 13. connector output schema invalid;
 14. policy update during waiting task;
 15. deployment while WAITING_APPROVAL;
 16. DB failover;
 17. Redis outage without losing critical state;
 18. backup restore;
 19. marketplace upgrade adding permission → new consent;
 20. billing usage duplicate → one ledger charge;
 21. AI Manager recursion/cycle;
 22. Document workflow waits days and resumes;
 23. model fallback only to allowed provider;
 24. RolePack tampering/checksum mismatch;
 25. catalog gate 500/500.
-

37. PRODUTO COMERCIAL E ESCALA

Installed $\neq$ Active $\neq$ Running.

Exemplo:

```
Installed: 500  
Active: 80  
Running: 12
```

Um AI Employee deve ser principalmente:

```
configuration  
+ rolepack  
+ permissions  
+ state  
+ memory references
```

e consumir capacidade quando tem trabalho.

Arquitectura deve evoluir para:

```
10,000 organizations  
100,000+ installed AI Employees  
millions of tasks/month
```

sem redesign fundamental, mas sem pré-provisionar custo desnecessário.

38. DEFINITION OF DONE GLOBAL

Uma funcionalidade só está concluída quando:

- código implementado;
- tipos/schema definidos;
- migration criada quando necessária;
- testes escritos;
- testes executados;
- testes críticos passam;
- security/evaluation consideradas;
- observability considerada;
- documentação actualizada;
- known limitations declaradas.

Um Role Pack só é `MARKETPLACE_READY` após:

```
schema valid
catalog identity valid
permissions valid
tools valid
risk/approval valid
evaluation passed
security passed
audit enabled
version/checksum assigned
publisher requirements satisfied
```

39. ROADMAP DE EXECUÇÃO PARA A IA

Fase A — Repository & Baseline

- inspeccionar código;
- executar testes;
- mapear módulos;
- verificar migrations;
- verificar Registry e Runtime.

Gate: baseline reproduzível.

Fase B — V2 Catalog 500/500

- carregar schema;
- carregar 500 Role Packs;
- validar manifest;
- atualizar CI 286→500.

Gate: ROLEPACK CATALOG: 500/500 VALID .

Fase C — P03 Tool SDK

- implementar SDK;
- demo connector;
- first safe connectors.

Gate: tool safety/idempotency suite.

Fase D — P04 Evaluation

- engine, datasets, regression, certification;
- first five Role Packs curated.

Gate: blocking tests e certification workflow.

Fase E — P05 Durable Infrastructure

- repositories reais;
- Temporal;
- workers;
- outbox/inbox;

- DLQ;
- observability;
- backups.

Gate: crash/recovery/idempotency E2E.

Fase F — P02 Red Team

- threat model;
- attack library;
- fixes;
- regression tests.

Gate: zero blocking security findings.

Fase G — P01 UI/UX

- control plane;
- core screens;
- design system;
- accessibility.

Gate: critical journeys e permission-aware UX.

Fase H — P06 Marketplace/Billing

- marketplace;
- plans;
- metering;
- ledger;
- entitlements.

Gate: commercial integrity tests.

Fase I — P07 Release Readiness

- aggregate evidence;
- GO/CONDITIONAL_GO/NO_GO.

Gate: production release decision.

40. INSTRUÇÃO FINAL

Não recomece o projecto do zero se artefactos existentes forem fornecidos.

Não transforme este documento numa nova análise conceptual interminável.

Trabalhe:

```
inspect
→ preserve
→ implement
→ migrate
→ test
→ evaluate
→ attack
→ fix
→ retest
→ observe
→ release
```

O objectivo final é:

UM DIGITAL WORKFORCE OPERATING SYSTEM

500 ROLE PACKS CANÓNICOS

1 RUNTIME

1 REGISTRY

1 TOOL SDK

DURABLE EXECUTION

HUMAN CONTROL

SECURITY BY CONSTRUCTION

EVALUATION BEFORE AUTONOMY

MARKETPLACE CONTROLADO

BILLING AUDITÁVEL

ANEXO A — JSON SCHEMA OFICIAL DO ROLE PACK V2

O schema abaixo é parte integrante deste Prompt Mestre e deve ser usado na validação do catálogo.

```

ANEXO D — ACCEPTANCE TEST DEFINITIONS DISPONÍVEIS PARA A EXPANSÃO 287-500

Os casos abaixo foram gerados para os novos Role Packs 287-500 e devem ser importados pelo P04.

Casos críticos devem posteriormente ser curados manualmente; geração automática não substitui domain validation.

```

ANEXO E — VERIFICAÇÃO EMBUTIDA DO CATÁLOGO

Ao carregar este documento ou os seus artefactos derivados, executar logicamente:

```
const roles = canonicalCatalog.rolepacks;

assert(roles.length === 500);

const ids = roles.map(x => x.id).sort((a,b) => a-b);
assert(JSON.stringify(ids) === JSON.stringify(
  Array.from({ length: 500 }, (_, i) => i + 1)
));

assert(new Set(roles.map(x => x.role_key)).size === 500);

for (const role of roles) {
  validateAgainstRolePackSchemaV2(role);
  assert(role.autonomy.default <= role.autonomy.maximum);

  if (role.risk.level >= 4) {
    assert(role.approval_policy !== "AP.NONE");
  }

  const required = new Set(role.tools.required);
  for (const tool of role.tools.optional) {
    assert(!required.has(tool));
  }
}

console.log("ROLEPACK CATALOG: 500/500 VALID");
```

ANEXO F — DECLARAÇÃO DE INTEGRIDADE DO DOCUMENTO

Este documento deve ser tratado como **uma única especificação mestre**.

É intencional que contenha:

- visão de produto;
- V1;
- V2;
- P03;
- P04;
- P05;
- P02;
- P01;
- P06;
- P07;
- schemas;
- catálogo;
- acceptance tests disponíveis;
- release gates.

A IA de desenvolvimento não deve exigir os prompts antigos para compreender a arquitectura.

Se artefactos antigos existirem no repositório, eles devem ser usados como implementação/base histórica, mas **este ficheiro é suficiente para orientar a evolução técnica completa**.
